

PhishTrainer

Design Draft

Frontend Systems — Prof. Dr. Peter Braun — SS 2026

Overview

PhishTrainer is an interactive training application that teaches users to identify phishing emails through realistic simulated scenarios and instant feedback. This document presents the design draft including the screen flow, wireframes for all main screens, key design decisions, and notes on responsiveness and usability.

Screen Flow

The application consists of four main screens. The user starts at the Dashboard, launches a training session, works through scenarios one by one, and receives feedback after each decision. The History screen is accessible at any time from the Dashboard.

Figure 1: Screen flow diagram showing navigation between all four screens.

Wireframes

Dashboard

The Dashboard is the main hub of the application. It displays the user's current level, XP progress, accuracy ring, streak tracker, earned badges, and a difficulty selector. From here the user can start a new training session or navigate to the History screen.

Figure 2: Dashboard screen with gamification elements and training start.

Scenario + Decision

The Scenario and Decision screens are combined into a single view. The user reads the simulated phishing email, taps suspicious elements to mark them, selects a verdict (Phishing or Legitimate), and submits. Combining these two steps into one screen reduces unnecessary navigation and keeps the interaction focused.

Figure 3: Combined Scenario and Decision screen.

Feedback

After submitting a decision, the user is taken to the Feedback screen. This screen reveals whether the verdict was correct, explains each red flag in detail, and shows how many XP were earned. The user can then proceed to the next scenario or navigate to History.

Figure 4: Feedback screen with red flag explanations and XP summary.

History

The History screen gives an overview of all past training sessions. A summary row shows total scenarios completed, overall accuracy, and total XP. Filter buttons allow the user to view only correct answers, missed ones, or hard scenarios. Each session entry shows the scenario name, difficulty, flags found, result, and XP earned.

Design Decisions

- **Scenario and Decision combined:** Originally designed as two separate screens, we merged them into one to avoid showing the same email twice and to create a more natural reading-and-deciding flow.
- **Gamification elements:** A level system with XP, a streak tracker, and unlockable badges were added to the Dashboard to motivate continued use. These elements make the app

feel more engaging without distracting from the learning goal.

- **Red flag highlighting:** On the Scenario screen, users can actively mark suspicious elements before submitting. This encourages careful reading rather than guessing, and makes the Feedback screen more meaningful since the app can show exactly which elements were missed.
- **Minimal navigation:** The app intentionally has only two navigation items (Dashboard and History) to keep the interface simple and focused on the training flow.
- **Mock data:** All scenario content is stored as static JSON within the frontend. No backend is required, which keeps the project scope realistic and allows the app to run entirely in the browser.

Responsiveness and Usability

The application is designed with a mobile-first layout. All screens use a single-column layout that scales cleanly to wider screens by centering the content with a maximum width. Touch targets (buttons, verdict choices, suspicious element markers) are sized generously for use on both mobile and desktop.

The color scheme uses clear semantic colors: red for phishing indicators and missed flags, green for correct results, and purple as the primary brand color. All interactive elements provide visual feedback on selection.

AI Tools

This document was drafted with the support of Claude (Anthropic). The tool was used to assist with wording and structure; all design decisions and wireframes were created and reviewed by the team.
